Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Armand Fontaine 4 Brandy Lane Wichita Falls, TX 76306-2101

This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which

no wolf packs have established territories. 2) Allow wolves to roam freely outside the boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Lara Schifferns 115 Sansome St 400 San Francisco, CA 94109

\$Revisions: \$MsgTrackFlags: 0 DeliveredDate: 12/28/2007 02:57:35 PM Dr. Brian Millsap, State Administrator, U.S. Fish and Wildlife Service NM Dear Dr. U.S. Fish and Wildlife Service, The opportunity to comment on the rule-change for managing reintroduced Mexican gray wolves comes not a moment too soon. Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Gregory Falberg 19807 pacifica cir Huntington Beach, CA 92648-3021

White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, David Rindlaub 408 S. Venice Blvd. Apt. 209 Venice, CA 90291

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, cassian sandeberg 8810 pico blvd los angeles, CA 90035

The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Kyle Haines 1415 Johnson Ave Klamath Falls, OR 97601

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Gene Fox PO Box 1181 York Harbor, ME 03911

White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Dawna Beasecker 730 Haley Woods Kodak, TN 37764

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Michelle Sewald 1322 Hoffman Drive ERIE, CO 80516

This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Gerri Reaves 16442 Timberlakes DR #204 Fort Myers, FL 33908

The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Karen Carroll 1319 S. 166th St. Omaha, NE 68130

White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Leslie LaConte 7520 Brompton Rd., Apt. 679 Houston, TX 77025

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish

and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Annabelle Travis 5926 Hillside Dr. El Sobrante, CA 94803

The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which

no wolf packs have established territories. 2) Allow wolves to roam freely outside the boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Lynn Ledgerwood 2605 Otis St. SE Olympia, WA 98501

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, scott murphy 3307 weston st charlotte, NC 28209

White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, SARAH HUNNEWELL PO BOX 75 WATER MILL, NY 11976

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which

no wolf packs have established territories. 2) Allow wolves to roam freely outside the boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, stephen montgomery 7071 CHAPALA CANYON COURT SAN DIEGO, CA 92129

The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the boundaries

of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Leslie Mace 5932 Fredricks Road Sebastopol, CA 95472

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Sonda Gabriel 1016 Windward Way St. Augustine, FL 32080

White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Michele Roberts 401 12th Street South #709 Arlington, VA 22202

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which

no wolf packs have established territories. 2) Allow wolves to roam freely outside the boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Larry Niles 5809 Thrush Lane Madison, WI 53711

This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Douglas Diamond 2211 Riverside Aveue CB 311 Minneapolis, MN 55454

\$Revisions: \$MsgTrackFlags: 0 DeliveredDate: 12/28/2007 02:54:30 PM Dr. Brian Millsap, State Administrator, U.S. Fish and Wildlife Service NM Dear Dr. U.S. Fish and Wildlife Service, The opportunity to comment on the rule-change for managing reintroduced Mexican gray wolves comes not a moment too soon. Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Aelred Glidden 56500 Abbey Road Three Rivers, MI 49093

White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Marnie gaede 772 Caldera Curve South Fork, CO 81154

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Charles Hartik PO Box 461 Tonasket, WA 98855

This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Chris Ray 3441 Swan Creek Rd. Jonesville, NC 28642

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which no wolf packs have established territories. 2) Allow wolves to roam freely outside the

boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Robert Pavese 1986 Windsor Dr North Palm Beach, FL 33408

White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role. Thank you for your consideration. Sincerely, Judith Gottesman 2612 Webster St. #9 Berkeley, CA 94705

Fish and Wildlife Service management, with its heavy reliance on predator control targeting the wolves, has suppressed the wolf population and contributed to inbreeding. The solution must comply with the conservation mandate of the Endangered Species Act and not allow loss of wolves - from any and all sources, including government take and illegal poaching - to keep the population from rapid growth and genetic rescue. To this end, please develop a Conservation Alternative to be analyzed in the draft environmental impact statement that would upgrade the legal status of the reintroduced Mexican wolves from their current "experimental non-essential" standing to a fully protected endangered status. Please do not include any alternative for analysis that would increase take of wolves, set any limits on wolf numbers, restrict their movements, or in any other respect infringe on the potential of establishing additional Mexican wolf populations, one of which is already called for in the 1982 Mexican Wolf Recovery Plan and more of which will likely be required in a future revision of that plan. The Conservation Alternative should include the following provisions: 1) Allow release of wolves from the captive breeding population directly into New Mexico. This is particularly important to enable the Fish and Wildlife Service to release genetically valuable animals into areas in which

no wolf packs have established territories. 2) Allow wolves to roam freely outside the boundaries of the Blue Range Wolf Recovery Area and not be geographically constrained by any other politically derived restrictions - just as other endangered species are allowed free movement. 3) Require livestock owners using public lands to remove or render inedible the carcasses of non-wolf-killed stock so as to prevent wolves from being attracted to areas where domestic animals are vulnerable and habituating to preying on stock. This could be accomplished, at least in part, by holding blameless for subsequent depredations any wolf that has scavenged on dead livestock - and protecting such wolves from any governmental or private "take" or predator control. 4) Authorize release of wolves into the White Sands Wolf Recovery Area, which is just a few dozen miles to the east of the Blue Range Wolf Recovery Area. White Sands has already been analyzed for its suitability for wolves and could serve as a home for genetically valuable wolves that might not otherwise be released. White Sands has only been found "unsuitable" if wolves are required to stay within its boundaries, but as part of a population that interacts with wolves in the Gila, it would serve an important role.
