Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mr. Andrew Peters  
708 Huffine Manor Cir  
Franklin, TN 37067-5682

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Diane Rooney

Brian Millsap

Dear Millsap,

I am a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After reintroduction efforts of 10years, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

1st, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

2nd, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

3rd, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for your consideration of my viewpoints on this incredibly important matter.

Sincerely,

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mr. Walter Salmon, Jr,  
1 Delavan Ter  
Yonkers, NY 10703-2901

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act. Take the politics out of survival of the wolves who have no voice in it.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves. Do what ever needs to be done in order to have them thrive where they can and want to be.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Alana Balogh

Brian Millsap

Dear Millsap,

I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60

wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Mary Charles

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery

efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Dawn Dippre

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Ms. Oracle  
PO Box 969

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Dr. Karen Milstein

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery

efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mr. Joseph Coventry

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Rebekah Osborn

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery

efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mr. Steven Stranak  
2056 W 91st St  
Cleveland, OH 44102-3748

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Alexa Morgan

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mr. James Marquez  
307 E 10th St  
Santa Ana, CA 92701-3711

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mr. Ronald Walters  
14834 W Verde Ln  
Goodyear, AZ 85395-8918

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery

efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Jenae Neiderhiser

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery

efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Wendy Stone

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Diane Jalbert  
271 Connecticut Ave NE  
Atlanta, GA 30307-2211

Brian Millsap

Dear Millsap,

This is the only world we have. I would like my kids and grandchildren one day to witness the wildlife in its natural habitat.

Please support the ecosystem and stop senseless killing and destroying

of our worlds wildlife.

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mrs. Michelle Phillips

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to strongly urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Dr. John Stickle, D.C.

Dec 22, 2007

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mr. Richard Stewart  
7882 13th St  
Westminster, CA 92683-4432

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Miss nicole ramos

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mrs. Shirley Foster  
2018 19th Ave W  
Bradenton, FL 34205-4614

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Miss Britni Strickland

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Sara Miller

Brian Millsap

Dear Millsap,

I write concerning a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule:

Uplist the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Do not limit wolf numbers, or allow any new reasons to kill them, and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

With commitment, it is absolutely possible to put the the Mexican gray wolf recovery program back on track.

Thank you for considering my viewpoints on this important matter.

Sincerely,

Ms. Ruth Rich

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery

efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Ms. Donna Panza

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mr. David Fontanella

Brian Millsap

Dear Millsap,

As a supporter of scientifically sound wildlife management who understands the value wolves can bring to ecosystems, I am writing to urge you to take a more balanced approach to Mexican wolf recovery efforts in the Southwest.

After ten years of reintroduction efforts, there are fewer than 60 wolves in the wild lands of the Southwest, more than 40 short of the reintroduction goal of establishing 102 wolves in the wild by 2006.

Mexican wolves are one of the most endangered animals in the world and play an important role in restoring balance to Southwest forests. But despite these facts, the Service hasn't made much progress in restoring them.

There are millions of acres of public land in the Southwest where wolves could thrive, but Mexican wolves continue to be confined to a much smaller, politically defined recovery area. The rules as they stand do not live up to the promise of the Endangered Species Act.

As one of 900,000 members and supporters of Defenders of Wildlife, I am asking you to make the following changes in the reintroduction rule.

First, "uplist" the Mexican wolf to Experimental Essential status. This will preserve the management flexibility of the rule, but require that other agencies consult about impacts on wolves.

Second, allow the wolves to disperse beyond the recovery area, and to be released where biologists say is best.

Third, don't limit wolf numbers, or allow any new reasons to kill them and ensure that any authorized removals take into account individual wolves' genetic value, the size and health of the population, the number of breeding pairs, and whether progress toward recovery is being made.

I am confident that if you make all of these changes, the Mexican gray wolf recovery program will get back on track and these wolves will have a real chance at recovery in the wild lands of the Southwest.

Thank you for considering my viewpoints on this incredibly important matter.

Sincerely,

Mrs. Linda Dygert
